Earth/matrix: SCIENCE IN ANCIENT ARTWORK

The Conversion of Degrees, Radians and the *Diametian* in Ancient Reckoning Counts

Presentation

In this essay, we shall present analyses of the ancient reckoning counts in relation to the procedures employed for converting degrees to radians and radians to degrees. The reader may be as surprised as this author to find a direct correlation between ancient reckoning counts and the conversion factors of degrees and radians.

We shall illustrate how the use of the *diametian* (*two radians*) improves the conceptual nature of the geometrical problematique in relation to the analyses of Unit Circles.

Part: General Background and Commentary

The conversion of degrees and radians:

$$180 / \pi = 57.29577951^\circ \text{ (one } \textit{radian})$$

$$180 / \textit{radian} = 3.141592654 \text{ (pi)}$$

The interesting point for the ancient reckoning system is that these two expressions are mediated by the number 180, which pertains to half the number of degrees in a circle as we know it today (360°). Many ancient reckoning counts are based upon the 9, 18, 36... count, and therefore relate easily to these particular formulae, as we shall observe in this essay.

The Conversion of Degrees and Radians

The conversion of degrees and radians is generally suggested by way of two formulae, and inversely thereof:

$$1^\circ = \pi \text{ rad} / 180$$

$$1 \text{ rad} = (180/\pi)^\circ$$

To convert from degrees to radians, *multiply by*

$$\pi \text{ rad} / 180$$

To convert from radians to degrees, *multiply by*

$$180^\circ / \pi \text{ radians}$$

The Conversion of Degrees and Radians

To convert from **degrees to radians**,

$$\text{Degrees} \div \text{Radian} = \text{Radian (\%)} \\ (3^\circ / 57.29577951 = .0523598776)$$

To convert from **radians to degrees**

$$\text{(\#) Radians} \times \text{Radian} = \text{Degrees} \\ (3 \times 57.29577951 = 171.8873385^\circ)$$

Defining The Diametian

$$360 / 3.141592654 = 114.591559 \text{ (*diametian*)}$$

A Unit Circle in our mind would have a diameter of **114.591559** when the circumference is divided into **360** degrees!

$$3.141592654 \times 114.591559011 = 360$$

$$\text{(*pi times diametian = 360*)}$$

In a Unit Circle of this nature, the Radius would be equal to one radian.

The Diametian

$$360 / 3.141592654 = 114.591559 \text{ (diameter)}$$

A 360-degree circle

Radius = Radian: 57.29577951

In a Unit Circle of this nature,
the Radius would be equal to one radian.

The Conversion of Degrees and the Diametian

To convert from Degrees to Diametians
(Two Radians)

$$\text{Degrees} \div \text{Diametian} = \text{Diametian (\%)} \\ (3^\circ / 114.591559 = .0261799388)$$

To convert from Diametians to Degrees

$$(\#) \text{Diametians} \times \text{Diametian} = \text{Degrees} \\ (3 \times 114.591559 = 343.7746677^\circ)$$

$$2\pi\text{Radius} = \text{circumference}$$

$$2 (\pi) .5 = 3.141592654$$

The circumference of a circle whose diameter is **1.0**

$$2 (\pi) 1.0 = 6.283185307 (2\pi)$$

The circumference of a Unit Circle in Geometry
whose diameter of **2.0**

The ***Length of the Arc*** (denoted by s) Intercepted by a Central Angle of Any Size in a Circle of Any Radius

Computations in Degrees:

$$s = \text{angle}/360 \times \text{Circumference}$$

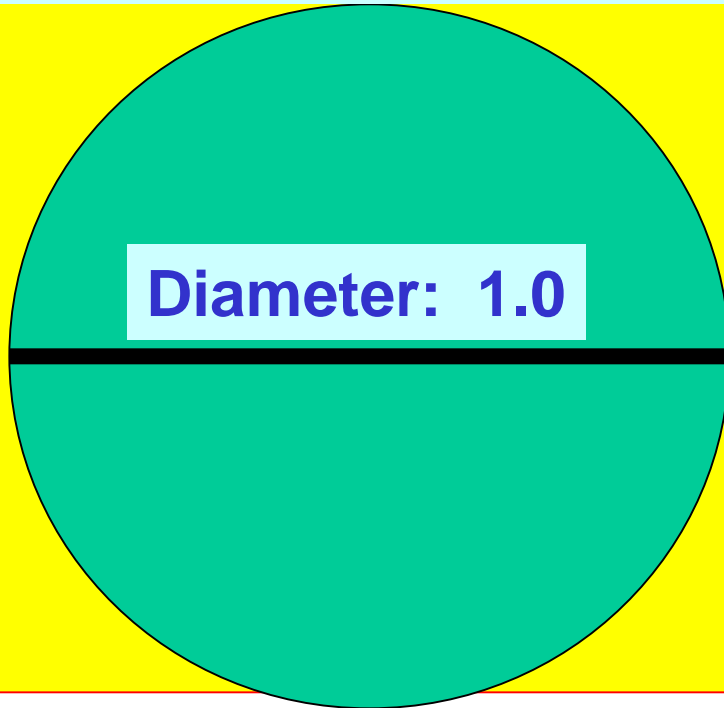

$$s = \text{angle}/360 \times 2\pi\text{Radius}$$

Computations in Radians:

$$s = aR \text{ (simply, the angle multiplied by the radius)}$$

Unit Circles

Circumference 3.141592654

Circumference 360°

These *Unit Circles*, as we have been discussing, yield the best results in computations with ancient reckoning.

Unit Circles

Circumference 2π

Diameter: 2.0

Radius: 1.0

Radian 57.29577951

Note: This is the Unit Circle that is cited in most geometry textbooks. It is simply twice the Unit Circle of diameter 1.0.

Circumference 360°

Diameter: 114.591559

Diametian 114.591559

The Radian and the Diametian

Radians

Some commonly cited angles
in *radians*: 57.29577951

| | | | |
|-------------|---|-----------|---------|
| 360° | = | 2π | radians |
| 270° | = | $3\pi/2$ | radians |
| 180° | = | π | radians |
| 90° | = | $\pi/2$ | radians |
| 75° | = | $5\pi/12$ | radians |
| 60° | = | $\pi/3$ | radians |
| 45° | = | $\pi/4$ | radians |
| 30° | = | $\pi/6$ | radians |
| 15° | = | $\pi/12$ | radians |
| 1° | = | $\pi/180$ | radians |

Diametians

Some commonly cited angles
in *diametians*: 114.591559

| | | | | |
|-------------|---|-----------|---|------------------|
| 360° | = | π | × | diametian |
| 270° | = | $3/4\pi$ | × | diametian |
| 180° | = | $1/2\pi$ | × | diametian |
| 90° | = | $1/4\pi$ | × | diametian |
| 75° | = | $5/24\pi$ | × | diametian |
| 60° | = | $\pi/6$ | × | diametian |
| 45° | = | $\pi/8$ | × | diametian |
| 30° | = | $\pi/12$ | × | diametian |
| 15° | = | $\pi/24$ | × | diametian |
| 1° | = | $\pi/360$ | × | diametian |

The Diametian

Commonly cited angles
in *diametians*: 114.591559

$$360^\circ = 1\pi \quad \times \quad 114.591559$$

$$270^\circ = 3/4\pi \quad \times \quad 114.591559$$

$$180^\circ = 1/2\pi \quad \times \quad 114.591559$$

$$90^\circ = 1/4\pi \quad \times \quad 114.591559$$

$$75^\circ = 1/4.8\pi \quad \times \quad 114.591559$$

$$60^\circ = 1/6\pi \quad \times \quad 114.591559$$

$$45^\circ = 1/8\pi \quad \times \quad 114.591559$$

$$30^\circ = 1/12\pi \quad \times \quad 114.591559$$

$$15^\circ = 1/24\pi \quad \times \quad 114.591559$$

$$1^\circ = 1/360\pi \quad \times \quad 114.591559$$

The Unit Circle is based upon a diameter of *114.591559*, whereby the *circumference* is exactly 360. By employing the *diametian (114.591559)* instead of the radian measure, one is simply emphasizing the concept of the “diameter” over that of “two radians”. The object is to draw attention in the computations to the length of the diameter. *The formulae are thus relational to the number of degrees cited.*

Traditional Rendering in Geometry

Angles commonly cited in Geometry Textbooks in *Radians*.
Unit Circle for Formulae is Actually an Half Circle (180°)

| | | | | |
|-------------------------------------|----------------------------|---------------------------------|----------------------------|---------------------------------|
| $360^\circ = 2$ | \times | 3.141592654 | \times | 57.29577951 |
| $270^\circ = 3/2$ | \times | 3.141592654 | \times | 57.29577951 |
| <u>$180^\circ = 1.0$</u> | <u>\times</u> | <u>3.141592654</u> | <u>\times</u> | <u>57.29577951</u> |
| $90^\circ = 1/2$ | \times | 3.141592654 | \times | 57.29577951 |
| $75^\circ = 5/12$ | \times | 3.141592654 | \times | 57.29577951 |
| $60^\circ = 1/3$ | \times | 3.141592654 | \times | 57.29577951 |
| $45^\circ = 1/4$ | \times | 3.141592654 | \times | 57.29577951 |
| $30^\circ = 1/6$ | \times | 3.141592654 | \times | 57.29577951 |
| $15^\circ = 1/12$ | \times | 3.141592654 | \times | 57.29577951 |
| $1^\circ = 1/180$ | \times | 3.141592654 | \times | 57.29577951 |

Note the complexity in recognizing the number of degrees and the corresponding fractional expression angle/180 by using the *radian* instead of the *diametian* (next slide).

Unit Circle 1.0 as 360° :: *Diametian*: 114.591559

| | | | | |
|-------------------|---|--------------------|---|-------------------|
| <u>360° = 1.0</u> | × | <u>3.141592654</u> | × | <u>114.591559</u> |
| 270° = 3/4 | × | 3.141592654 | × | 114.591559 |
| 180° = 1/2 | × | 3.141592654 | × | 114.591559 |
| 90° = 1/4 | × | 3.141592654 | × | 114.591559 |
| 75° = 1/4.8 | × | 3.141592654 | × | 114.591559 |
| 60° = 1/6 | × | 3.141592654 | × | 114.591559 |
| 45° = 1/8 | × | 3.141592654 | × | 114.591559 |
| 30° = 1/12 | × | 3.141592654 | × | 114.591559 |
| 15° = 1/24 | × | 3.141592654 | × | 114.591559 |
| 1° = 1/360 | × | 3.141592654 | × | 114.591559 |

Note how the ease of recognizing the number of degrees and the corresponding fractional expression angle/360 by using the *diametian* instead of the *radian*.

Conversion Examples

Conversion examples using the **756c Kemi count**:

$$\underline{\text{Degrees/radians:}} \quad 1^\circ = \pi \text{ rad} / 180$$

$$756^\circ / 180 = 4.2 \times \text{pi} = \mathbf{13.19468915 \text{ radians}}$$

$$\underline{\text{Radians/degrees:}} \quad 1 \text{ rad} = (180/\pi)^\circ$$

$$756 \text{ rad} \times 180 = 136080 / \text{pi} = \mathbf{43315.60931 \text{ degrees}}$$

Consider adjustment:

$$\underline{\mathbf{756 \text{ rad} \times 180 = 136080 / 3.15 = 43200 \text{ Consecration}}}$$

Conversion examples of the **1366560c Maya count**:

Degrees/radians: $1^\circ = \pi \text{ rad} / 180$

$$1366560^\circ / 180 = 7592$$

$$7592 \times \text{pi} = \underline{23850.97143 \text{ radians}}$$

Radians/degrees: $1 \text{ rad} = (180/\pi)^\circ$

$$1366560 \text{ rad} \times 180 = 245980800$$

$$245980800 / \text{pi} = 78298120.45 \text{ degrees}$$

Conversion examples of the **1366560c Maya count**
and the **1959552c Nineveh Count**:

Degrees/radians: $1^\circ = \pi \text{ rad} / 180$

$$1366560^\circ / 180 = 7592$$

$$7592 \times \pi = \underline{23850.97143 \text{ radians}}$$

23850 doubles to

$$195379200 - 195955200 = \mathbf{576000} \text{ (MLC fractal)}$$

$$7592 \times 2 = 15184 \text{ (maya counts)}$$

Conversion examples (*Sothic 1649.457812*):

Degrees/radians: $1^\circ = \pi \text{ rad} / 180$

$$\underline{1649.457812^\circ / 180 = 9.163654511}$$

$$\underline{9.163654511 \times \pi = 28.78846969 \text{ radians}}$$

Consider adjustment:

$$9.163654511 / 28.8 = .3181824483$$

$1 / .3181824483 = \text{ca. reciprocal of } \pi, 3.142850919$
as reciprocal of seven, 3.142857

*The reciprocal of pi, instead of pi, may be employed
to compute whole numbers.*

Conversion examples (13c):

Degrees/radians: $1^\circ = \pi \text{ rad} / 180$

$$\underline{13^\circ / 180 = .0722222222}$$

$$\underline{.0722222222 \times \pi = .2268928028 \text{ radians}}$$

$$\underline{.0722222222 / .2268 = .3184401332}$$

In this case the ancient 13c would represent degrees and the ancient 2268c of Nineveh would represent the radians.

13 degrees equals ca. .2268 radians

Conversion examples (25956c Maya Precession):

Degrees/radians: $1^\circ = \pi \text{ rad} / 180$

$$\underline{25956^\circ / 180 = 144.2} \times \underline{\text{pi}} = \underline{453.0176606 \text{ radians}}$$

$$144.2 / 453.6 = .3179012346$$

In this case the ancient maya144c would represent degrees and the ancient 4536c of Nineveh would represent the radians.

144 degrees equals ca. 453.6 radians

The Conversion of Degrees and Radians

180

3.141592654

Pi (π)

57.29577951

Radian

The relationship of the three numbers shown above relates to the conversion of degrees and radians of a circle. Yet, we may wonder how would they relate to the different ancient reckoning counts. Take two ancient Kemi counts: 756 and 42. Let us remember that 756c is often given as the side measurement of the Great Pyramid of Giza.

$$756 / 180 = 42$$

The Conversion of Degrees and Radians

$$756 / 180 = 42$$

$$756 / 3.141592654 = 240.642274 / 57.29577951 = 4.2$$

From the previous computation one may observe how the two Kemi counts are related as Pi and the Radian. Also, one may realize why the ancients may have disliked fractions, such as, 240.642274 which suggests the 6, 12, 24c... ancient reckoning constant count.

$$756 / 3.15 = 240.0 / 57.14285714 = 4.2$$

Fractionless reckoning counts may be obtained easily within the computation by changing pi to the ancient 3.15 number and employing the reciprocal of seven number for the radian.

The Conversion of Degrees and Radians

$$756 / 3.15 = 240.0 / 57.14285714 = 4.2$$

In this manner, one is able to obtain a relationship among three distinct ancient reckoning counts by way of two geometrical constants: pi and the radian. It is difficult to imagine that the ancients chose three distinct reckoning counts simply out of happenstance, when we observe their direct relationship to the geometrical constants. In other words, it is easy to understand that 756c and 42c are related to the 180 count, but then, to observe their relationship to yet another third count, by way of the two geometrical constants defies logic.

If the reciprocal of seven appears bothersome, we simple invert it to its own reciprocal (175, 350, 700...):

$$756 / 3.15 = 240.0 \times \underline{.0175} = 4.2$$

The Conversion of Degrees, Radians and the Diametian

$$360 / 3.141592654 = 114.591559 \text{ (diametian)}$$

A Unit Circle in our mind would have a diameter of **114.591559** when the circumference is divided into **360** degrees!

$$3.141592654 \times 114.591559011 = 360$$

$$\text{(pi times diametian = 360)}$$

In a Unit Circle of this nature, the Radius would be equal to one radian.

The Conversion of Degrees and Radians

$$\begin{array}{l} 180 / 3.141592654 = 57.29577951 / 57.29577951 = 1.0 \\ \text{degrees} \qquad \qquad \qquad \text{radius} \qquad \qquad \qquad \text{radian} \end{array}$$

$$\begin{array}{l} 360 / 3.141592654 = 114.591559 / 57.29577951 = 2.0 \\ \text{degrees} \qquad \qquad \qquad \text{diameter} \qquad \qquad \qquad \text{radians} \end{array}$$

Now, let us suppose that the ancients divided a circle into as many degrees or divisions (segments) as they required for their computations. Let us suppose that they divided a circle into 756c degrees, instead of the 360-degree circle that we have inherited today.

$$\begin{array}{l} 756 / 3.141592654 = 240.642274 / 57.29577951 = 4.2 \\ \text{degrees} \qquad \qquad \qquad (4.2 \text{ radians}) \qquad \qquad \qquad \text{radians} \end{array}$$

$$\begin{array}{l} 240.642274 \times 114.591559 = 27575.57334 / \text{radian} = \underline{481.2845479} \\ 4.2 \text{ radians} \times 2 \text{ radians} = \qquad \qquad \qquad \underline{8.4 \text{ radians}} \end{array}$$

The Conversion of Degrees and Radians

$$\begin{array}{l} \mathbf{756} / 3.141592654 = \mathbf{240.642274} / 57.29577951 = \mathbf{4.2} \\ \mathbf{degrees} \qquad \qquad \qquad \mathbf{(4.2 \text{ radians})} \qquad \qquad \qquad \mathbf{radians} \end{array}$$

$$\begin{array}{l} \mathbf{1512} / 3.141592654 = \mathbf{481.2845479} / 57.29577951 = \mathbf{8.4} \\ \mathbf{degrees} \qquad \qquad \qquad \mathbf{8.4 \text{ radians}} \qquad \qquad \qquad \mathbf{radians} \end{array}$$

Note the pi-like relationship to the projected height of the Great Pyramid of Giza (481.5 feet), which would represent theoretically at least, 8.4 radians.

Selected Historically Significant Reckoning Counts in Relation to the Conversion of Degrees and Radians

The historically significant counts that we have selected on the following slides are related ultimately as of the 18 count (36c). One merely has to divide one of the extreme terms of the following equations by its corresponding extreme term, in order to visualize this particular relationship. Yet, the significant point is the manner in which the counts relate to the pi and the radian expressions and the third or middle count posted within each equation. The middle term of the equation may be read as x radians or, as the length of the diameter for the circumference of each corresponding circle.

$$\begin{array}{l} \mathbf{1872000} \text{ / } 3.141592654 = \mathbf{595876.1069} \text{ / } 57.29577951 = \mathbf{10400} \\ \text{\textit{degrees}} \qquad \qquad \qquad \text{\textit{5200 diametians}} \qquad \qquad \qquad \text{\textit{radians}} \end{array}$$

$$\begin{array}{l} \mathbf{1872000} \text{ / } 3.141592654 = \mathbf{595876.1069} \text{ / } 57.29577951 = \mathbf{10400} \\ \text{\textit{circumference}} \qquad \qquad \qquad \text{\textit{diameter}} \qquad \qquad \qquad \text{\textit{radians}} \end{array}$$

The Conversion of Degrees and Radians

The Maya Long-Count Period (**1872000**) and
the Mesoamerican Century (**104c**)

$$\begin{aligned} 1872000 / 3.141592654 &= 595876.1069 / 57.29577951 = 10400 \\ 1872000 / 57.29577951 &= 32672.5636 \text{ radians} \quad \text{radians} \end{aligned}$$

The Sacred Seven Count (**7c**) and
the Mesoamerican Count (**3888c**)

$$\begin{aligned} 7 / 3.141592654 &= 2.228169203 / 57.29577951 = .0388888889 \\ 7 / 57.29577951 &= .1221730476 \text{ radians} \quad \text{radians} \end{aligned}$$

The Consecration Count (**432c**) and
the Constant Count (**24c**)

$$\begin{aligned} 432 / 3.141592654 &= 137.5098708 / 57.29577951 = 2.4 \\ 432 / 57.29577951 &= 7.53822369 \text{ radians} \quad \text{radians} \end{aligned}$$

The Conversion of Degrees and Radians

The Precessional Great Cycle (**25920c**) and
the Maya Long-Count Fractal (**144c**)

$$\begin{aligned} 25920 / 3.141592654 &= 8250.59225 / 57.29577951 = 144 \\ 25920 / 57.29577951 &= 452.3893421 \text{ radians} \quad \text{radians} \end{aligned}$$

The Maya Precession Count (**25956c**) and
the Adjusted Maya Long-Count (**72.1c, 144.2c**)

$$\begin{aligned} 25956 / 3.141592654 &= 8262.051406 / 57.29577951 = 144.2 \\ 25956 / 57.29577951 &= 453.0176607 \text{ radians} \quad \text{radians} \end{aligned}$$

The Maya Long-Count (**144c**) and
the Constant Number Count (**1, 2, 4, 8c**)

$$\begin{aligned} 144000 / 3.141592654 &= 45836.62361 / 57.29577951 = 800 \\ 144000 / 57.29577951 &= 2513.274123 \text{ radians} \quad \text{radians} \end{aligned}$$

The Conversion of Degrees and Radians

Half the Maya Long-Count Period (**936000c**) and
the Mesoamerican Calendar Round (**52c**)

$$\begin{aligned} 936000 / 3.141592654 &= 297938.0535 / 57.29577951 = 5200 \\ 936000 / 57.29577951 &= 16336.2818 \text{ radians} \quad \text{radians} \end{aligned}$$

The Nineveh Count (**2268c**) and
the Constant Number Series (**63c, 126c**)

$$\begin{aligned} 2268 / 3.141592654 &= 721.9268219 / 57.29577951 = 12.6 \\ 2268 / 57.29577951 &= 39.58406744 \text{ radians} \quad \text{radians} \end{aligned}$$

The Mesoamerican Count (**2187c**) and
the Cuicuilco Count (**1215c**)

$$\begin{aligned} 2187 / 3.141592654 &= 696.1437211 / 57.29577951 = 12.15 \\ 2187 / 57.29577951 &= 38.17035074 \text{ radians} \quad \text{radians} \end{aligned}$$

The Conversion of Degrees and Radians

The Adjusted Year Count (**365c**) and
the Mesoamerican Legend of the Fifth Sun Count (**2028c**)

$$\begin{aligned} 36504 / 3.141592654 &= 11619.58409 / 57.29577951 = 2028 \\ 36504 / 57.29577951 &= 637.1149902 \text{ radians} \quad \text{radians} \end{aligned}$$

The Maya Companion Number (**1366560c**) and
the Calendar Round in Days (**1898, 3796, 7592c**)

$$\begin{aligned} 1366560 / 3.141592654 &= 434989.5581 / 57.29577951 = 7592 \\ 1366560 / 57.29577951 &= 23850.97143 \text{ radians} \quad \text{radians} \end{aligned}$$

The Mesoamerican Count (**7776c**) and
the Consecration Count (**432c**)

$$\begin{aligned} 7776 / 3.141592654 &= 2475.177675 / 57.29577951 = 43.2 \\ 7776 / 57.29577951 &= 135.7168026 \text{ radians} \quad \text{radians} \end{aligned}$$

The Conversion of Degrees and Radians

**The Venus Day-Count (585c) and
the Mesoamerican Thirteen Count (3.25, 6.5, 13c)**

$$\begin{aligned} 585 / 3.141592654 &= 186.2112834 / 57.29577951 = 3.25 \\ 585 / 57.29577951 &= 10.21017612 \text{ radians} \quad \text{radians} \end{aligned}$$

**The Nineveh Number (1959552c) and
the Mesoamerican Count (108864c)**

$$\begin{aligned} 19595520 / 3.141592654 &= 6237447.741 / 57.29577951 = 108864 \\ 19595520 / 57.29577951 &= 342006.3427 \text{ radians} \quad \text{radians} \end{aligned}$$

**The Maya Historical Count (1404000c) and
the Mesoamerican Count (39, 78c)**

$$\begin{aligned} 1404000 / 3.141592654 &= 446907.0802 / 57.29577951 = 7800 \\ 1404000 / 57.29577951 &= 24504.4227 \text{ radians} \quad \text{radians} \end{aligned}$$

To convert degrees to radians multiply by **.017453**

$$5198.00893 / \pi = 1654.577631$$

$$5198.00893 / \text{rad} = 90.72237038$$

$$1654.577631 + 90.72237038 = \underline{1745.300001}$$

$$5198.00893 / 2 = \underline{2599.004465} \text{ precession}$$

$$1654.577631 / 90.72237038 = 18.23781306$$
$$36.47562611$$

A Novelty: The Conversion Factor

$$5198.009 / \text{rad} = 90.7223716 \quad (9072, 4536, 2268)$$

$$5198.009 / \text{pi} = 1654.577653$$

$$90.7223716 + 1654.577653 = \underline{1745.300025}$$

[To convert degrees to radians multiply by .017453]

$$360 \times .017453 = 2\text{pi} (6.28308)$$

$$2\text{pi} / 360 = \underline{.0174532925 \text{ exact}}$$

$$\text{pi} / 180 = \text{same}$$

Sothic 1649.457812 - 1654.577653 = 5.119841
doubles to 81.917456 [kawil 819c + 1745c]

As one may discern from the previous analysis, there appears to exist a direct relationship between the ancient reckoning counts and the basic procedures in geometry. It seems difficult to imagine the possibility that the ancients chose their ancient reckoning counts outside of the posits of geometry. Ancient artwork reflects an infinite number of geometrical designs. It is not at all surprising to find a link between the ancient historically significant numbers, and the procedures within geometry. Coincidence no longer is involved, once one is able to predict and extrapolate computations in the manner that the ancient reckoning numbers achieve in relation to the posits of classical geometry.
